

User Management System

Domain Model - A domain model as a type of flowchart that shows the activities and concepts of a given topic. It is a basis of a software design.

Below is the domain model of User Management System. The. Diagram shows, a user belongs to a group and there could be multiple groups and each group can have different permissions.

Database Model - A Database model is the representation of logical structure of database. It includes the relationship and constraints that determines how data can be stored and accessed.

Below is the data model using ER diagram:

Data Model - User Management System
